	L16	Validate Variable Setters	Unresolved
	L19	Stable Compiler Version	Unresolved

Table of Contents

Risk Classification

The criticality of findings in Cyberscope's smart contract audits is determined by evaluating multiple variables. The two primary variables are:

1. **Likelihood of Exploitation**: This considers how easily an attack can be executed, including the economic feasibility for an attacker.
2. **Impact of Exploitation**: This assesses the potential consequences of an attack, particularly in terms of the loss of funds or disruption to the contract's functionality.

Based on these variables, findings are categorized into the following severity levels:

1. **Critical**: Indicates a vulnerability that is both highly likely to be exploited and can result in significant fund loss or severe disruption. Immediate action is required to address these issues.
2. **Medium**: Refers to vulnerabilities that are either less likely to be exploited or would have a moderate impact if exploited. These issues should be addressed in due course to ensure overall contract security.
3. **Minor**: Involves vulnerabilities that are unlikely to be exploited and would have a minor impact. These findings should still be considered for resolution to maintain best practices in security.
4. **Informative**: Points out potential improvements or informational notes that do not pose an immediate risk. Addressing these can enhance the overall quality and robustness of the contract.

Severity	Likelihood / Impact of Exploitation
Critical	Highly Likely / High Impact
Medium	Less Likely / High Impact or Highly Likely/ Lower Impact
Minor / Informative	Unlikely / Low to no Impact

Review

Contract Name	MetalBankX
Compiler Version	v0.8.29+commit.ab55807c
Optimization	200 runs
Explorer	https://etherscan.io/address/0x75b45b0fd4a33ff3db856b24bf9c2c13f48e8eaf

CCR - Contract Centralization Risk

Criticality	Minor / Informative
Location	MetalBankX.sol#L104,115
Status	Unresolved

Description

The contract's functionality and behavior are heavily dependent on external parameters or configurations. While external configuration can offer flexibility, it also poses several centralization risks that warrant attention. Centralization risks arising from the dependence on external configuration include Single Point of Control, Vulnerability to Attacks, Operational Delays, Trust Dependencies, and Decentralization Erosion.

Specifically, in the `receive` function, users pay an amount of ETH in order to buy tokens. The tokens are kept in the address of the `fundsWallet` however the `fundsWallet` could transfer all the funds into another account resulting in users not being able to buy tokens.

```
constructor(uint256 initialSupply) StandardToken(initialSupply) {
    _totalSupply = 100000000000000000000000000;
    balances[msg.sender] = 100000000000000000000000000000;
    //...
    fundsWallet = msg.sender;
}

receive() external payable {
    //...
    require(balances[fundsWallet] >= amount);
    balances[fundsWallet] -= amount;
    balances[msg.sender] += amount;
    //...
}
```

Recommendation

To address this finding and mitigate centralization risks, it is recommended to evaluate the feasibility of migrating critical configurations and functionality into the contract's codebase itself. This approach would reduce external dependencies and enhance the contract's self-sufficiency. It is essential to carefully weigh the trade-offs between external configuration flexibility and the risks associated with centralization.

IDI - Immutable Declaration Improvement

Criticality	Minor / Informative
Location	MetalBankX.sol#L104,106,107,112
Status	Unresolved

Description

The contract declares state variables that their value is initialized once in the constructor and are not modified afterwards. The `immutable` is a special declaration for this kind of state variable that saves gas when it is defined.

```
decimals
unitsOneEthCanBuy
fundsWallet
totalEthInWei
```

Recommendation

By declaring a variable as immutable, the Solidity compiler is able to make certain optimizations. This can reduce the amount of storage and computation required by the contract, and make it more gas-efficient.

MTEE - Missing Transfer Event Emission

Criticality	Minor / Informative
Location	MetalBankX.sol#L89,104
Status	Unresolved

Description

The contract does not emit an event when portions of the main amount are transferred during the transfer process. This lack of event emission results in decreased transparency and traceability regarding the flow of tokens, and hinders the ability of decentralized applications (dApps), such as blockchain explorers, to accurately track and analyze these transactions.

```
    constructor(uint256 initialSupply) {
         _totalSupply = initialSupply;
         balances[msg.sender] = _totalSupply;
     }
     //...
     constructor(uint256 initialSupply) StandardToken(initialSupply)
{
         //...
         balances[msg.sender] = 1000000000000000000000000000000;
         //...
     }
```

Recommendation

It is advisable to incorporate the emission of detailed event logs following each asset transfer. These logs should encapsulate key transaction details, including the identities of the sender and receiver, and the quantity of assets transferred. Implementing this practice will enhance the reliability and transparency of transaction tracking systems, ensuring accurate data availability for ecosystem participants.

NWES - Nonconformity with ERC-20 Standard

Criticality	Minor / Informative
Location	MetalBankX.sol#L55,63
Status	Unresolved

Description

The contract does not fully conform to the ERC20 Standard. Specifically, according to the standard, transfers of 0 values must be treated as normal transfers and fire the Transfer event. However, the contract implements a conditional check that prohibits transfers of 0 values. This discrepancy between the contract's implementation and the ERC20 standard may lead to inconsistencies and incompatibilities with other contracts.

```
function transfer(address _to, uint256 _value) public override
returns (bool success) {
    require(balances[msg.sender] >= _value && _value > 0,
"Insufficient balance");
        //...
}

function transferFrom(address _from, address _to, uint256 _value)
public override returns (bool success) {
    require(balances[_from] >= _value && allowed[_from][msg.sender]
>= _value && _value > 0, "Transfer not allowed");
    //...
}
```

Recommendation

The incorrect implementation of the ERC20 standard could potentially lead to problems when interacting with the contract, as other contracts or applications that expect the ERC20 interface may not behave as expected. The team is advised to review and revise the implementation of the transfer mechanism to ensure full compliance with the ERC20 standard. https://eips.ethereum.org/EIPS/eip-20.

RBTS - Resetting Balance and Total Supply

Criticality	Minor / Informative
Location	MetalBankX.sol#L105,106
Status	Unresolved

Description

In the `MetalBankX.constructor`, the parameter `initialSupply` is added as input in the `StadardToken.constructor`. This sets the `_totalSupply` and balance of `msg.sender` to that value. However, after that, the `_totalSupply` and the balance of the sender are reassigned to fixed values.

```
constructor(uint256 initialSupply) {
        _totalSupply = initialSupply;
        balances[msg.sender] = _totalSupply;
}
//...
constructor(uint256 initialSupply) StandardToken(initialSupply) {
        _totalSupply = 100000000000000000000000000;
        balances[msg.sender] = 100000000000000000000000000;
        //...
}
```

Recommendation

To maintain consistency and ensure that the intended supply is respected, it is recommended to remove or properly handle the redundant reassignment of `_totalSupply` and `balances[msg.sender]` within the `MetalBankX.constructor`.

TFPC - Token Fixed Price Concern

Criticality	Minor / Informative
Location	MetalBankX.sol#L117
Status	Unresolved

Description

The contract sells tokens at a fixed price of 10000 tokens per wei. However, the price on decentralized exchanges may fluctuate, potentially creating discrepancies (e.g. on a decentralized exchange 12000 tokens may be available for 1 wei). This could lead to opportunities for token holders or buyers that may not align with the intended business logic or the market dynamics.

```
receive() external payable {
    //...
    uint256 amount = msg.value * unitsOneEthCanBuy;
    //...
}
```

Recommendation

It is recommended that the team take into account that token prices on other decentralized applications (like a decentralized exchange) may vary from the intended price set by the contract, potentially creating discrepancies that could impact the token's market behavior and buyer expectations.

UCM - Unnecessary Comment Messages

Criticality	Minor / Informative
Location	MetalBankX.sol#L110
Status	Unresolved

Description

The contract is using unnecessary comment messages. These comment may make it difficult to understand the source code.

```
// Adjust the price of your token here
```

Recommendation

The team is advised to carefully review the comment to improve code readability.

L02 - State Variables could be Declared Constant

Criticality	Minor / Informative
Location	MetalBankX.sol#L94
Status	Unresolved

Description

State variables can be declared as constant using the constant keyword. This means that the value of the state variable cannot be changed after it has been set. Additionally, the constant variables decrease gas consumption of the corresponding transaction.

```
string public version = 'H1.0'
```

Recommendation

Constant state variables can be useful when the contract wants to ensure that the value of a state variable cannot be changed by any function in the contract. This can be useful for storing values that are important to the contract's behavior, such as the contract's address or the maximum number of times a certain function can be called. The team is advised to add the constant keyword to state variables that never change.

L04 - Conformance to Solidity Naming Conventions

Criticality	Minor / Informative
Location	MetalBankX.sol#L51,59,68,72,78,125
Status	Unresolved

Description

The Solidity style guide is a set of guidelines for writing clean and consistent Solidity code. Adhering to a style guide can help improve the readability and maintainability of the Solidity code, making it easier for others to understand and work with.

The followings are a few key points from the Solidity style guide:

1. Use camelCase for function and variable names, with the first letter in lowercase (e.g., myVariable, updateCounter).
2. Use PascalCase for contract, struct, and enum names, with the first letter in uppercase (e.g., MyContract, UserStruct, ErrorEnum).
3. Use uppercase for constant variables and enums (e.g., MAX_VALUE, ERROR_CODE).
4. Use indentation to improve readability and structure.
5. Use spaces between operators and after commas.
6. Use comments to explain the purpose and behavior of the code.
7. Keep lines short (around 120 characters) to improve readability.

```
uint256 _value
address _to
address _from
address _owner
address _spender
bytes memory _extraData
```

Recommendation

By following the Solidity naming convention guidelines, the codebase increased the readability, maintainability, and makes it easier to work with.
Find more information on the Solidity documentation
https://docs.soliditylang.org/en/stable/style-guide.html#naming-conventions.

L16 - Validate Variable Setters

Criticality	Minor / Informative
Location	MetalBankX.sol#L129
Status	Unresolved

Description

The contract performs operations on variables that have been configured on user-supplied input. These variables are missing of proper check for the case where a value is zero. This can lead to problems when the contract is executed, as certain actions may not be properly handled when the value is zero.

```
(bool successCall, ) =
_spender.call(abi.encodeWithSignature("receiveApproval(address,uint256,address
,bytes)", msg.sender, _value, address(this), _extraData))
```

Recommendation

By adding the proper check, the contract will not allow the variables to be configured with zero value. This will ensure that the contract can handle all possible input values and avoid unexpected behavior or errors. Hence, it can help to prevent the contract from being exploited or operating unexpectedly.

L19 - Stable Compiler Version

Criticality	Minor / Informative
Location	MetalBankX.sol#L2
Status	Unresolved

Description

The `^` symbol indicates that any version of Solidity that is compatible with the specified version (i.e., any version that is a higher minor or patch version) can be used to compile the contract. The version lock is a mechanism that allows the author to specify a minimum version of the Solidity compiler that must be used to compile the contract code. This is useful because it ensures that the contract will be compiled using a version of the compiler that is known to be compatible with the code.

```
pragma solidity ^0.8.0;
```

Recommendation

The team is advised to lock the pragma to ensure the stability of the codebase. The locked pragma version ensures that the contract will not be deployed with an unexpected version. An unexpected version may produce vulnerabilities and undiscovered bugs. The compiler should be configured to the lowest version that provides all the required functionality for the codebase. As a result, the project will be compiled in a well-tested LTS (Long Term Support) environment.

Functions Analysis

Summary

MetalBankX contract implements a token mechanism. This audit investigates security issues, business logic concerns and potential improvements. MetalBankX is an interesting project that has a friendly and growing community. The Smart Contract analysis reported no compiler error or critical issues. The contract does not implement any fees.

This report is not nor should be regarded as an indication of the economics or value of any "product" or "asset" created by any team or project that contracts Cyberscope to perform a security assessment. This document does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors' business, business model or legal compliance. This report should not be used in any way to make decisions around investment or involvement with any particular project. This report represents an extensive assessment process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk Cyberscope's position is that each company and individual are responsible for their own due diligence and continuous security Cyberscope's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies and in no way claims any guarantee of security or functionality of the technology we agree to analyze. The assessment services provided by Cyberscope are subject to dependencies and are under continuing development. You agree that your access and/or use including but not limited to any services reports and materials will be at your sole risk on an as-is where-is and as-available basis Cryptographic tokens are emergent technologies and carry with them high levels of technical risk and uncertainty. The assessment reports could include false positives false negatives and other unpredictable results. The services may access and depend upon multiple layers of third parties.

About Cyberscope

Cyberscope is a blockchain cybersecurity company that was founded with the vision to make web3.0 a safer place for investors and developers. Since its launch, it has worked with thousands of projects and is estimated to have secured tens of millions of investors' funds.

Cyberscope is one of the leading smart contract audit firms in the crypto space and has built a high-profile network of clients and partners.
