About Cyberscope	17

Risk Classification

The criticality of findings in Cyberscope's smart contract audits is determined by evaluating multiple variables. The two primary variables are:

1. **Likelihood of Exploitation:** This considers how easily an attack can be executed, including the economic feasibility for an attacker.
2. **Impact of Exploitation:** This assesses the potential consequences of an attack, particularly in terms of the loss of funds or disruption to the contract's functionality.

Based on these variables, findings are categorized into the following severity levels:

1. **Critical:** Indicates a vulnerability that is both highly likely to be exploited and can result in significant fund loss or severe disruption. Immediate action is required to address these issues.
2. **Medium:** Refers to vulnerabilities that are either less likely to be exploited or would have a moderate impact if exploited. These issues should be addressed in due course to ensure overall contract security.
3. **Minor:** Involves vulnerabilities that are unlikely to be exploited and would have a minor impact. These findings should still be considered for resolution to maintain best practices in security.
4. **Informative:** Points out potential improvements or informational notes that do not pose an immediate risk. Addressing these can enhance the overall quality and robustness of the contract.

Severity	Likelihood / Impact of Exploitation
● Critical	Highly Likely / High Impact
● Medium	Less Likely / High Impact or Highly Likely/ Lower Impact
● Minor / Informative	Unlikely / Low to no Impact

Overview

BigTrPresale is a single contract that runs a capped stage token presale. Buyers pay one whitelisted 18 decimal stablecoin to buy BIGTR allocations, priced on a stage schedule that steps up as each stage fills, with cross stage purchases split and priced correctly in one transaction, and buyers can set a floor on how many tokens they are willing to accept for a given payment. Payment goes straight to a treasury, and the contract only records each buyer's allocation for a separate distribution contract to pay out later it never holds or delivers BIGTR itself.

Findings Breakdown

● Critical	0
● Medium	0
● Minor / Informative	3

Severity	Unresolved	Acknowledged	Resolved	Other
● Critical	0	0	0	0
● Medium	0	0	0	0
● Minor / Informative	0	3	0	0

Diagnostics

● Critical ● Medium ● Minor / Informative

Severity	Code	Description	Status
●	CCR	Contract Centralization Risk	Acknowledged
●	DCT	Distribution Contract Trust	Acknowledged
●	UPTV	Unverified Payment Token Valuation	Acknowledged

CCR - Contract Centralization Risk

Criticality	Minor / Informative
Location	BigTrPresale_1.sol
Status	Acknowledged

Description

The contract's functionality and behavior are heavily dependent on external parameters or configurations. While external configuration can offer flexibility, it also poses several centralization risks that warrant attention. Centralization risks arising from the dependence on external configuration include Single Point of Control, Vulnerability to Attacks, Operational Delays, Trust Dependencies, and Decentralization Erosion.

```
setPayToken(address token, bool accepted) external onlyOwner
setTreasury(address t) external onlyOwner
function pause() external onlyOwner { _pause(); }
function unpause() external onlyOwner { _unpause(); }
function finalize() external onlyOwner
```

Recommendation

To address this finding and mitigate centralization risks, it is recommended to evaluate the feasibility of migrating critical configurations and functionality into the contract's codebase itself. This approach would reduce external dependencies and enhance the contract's self-sufficiency. It is essential to carefully weigh the trade-offs between external configuration flexibility and the risks associated with centralization.

Team Update

The team has acknowledged that this is not a security issue and states:

Owner and treasury will be multisig wallets on mainnet, and ownership transfers are two-step (Ownable2Step).

DCT - Distribution Contract Trust

Criticality	Minor / Informative
Location	BigTrPresale_1.sol#L70
Status	Acknowledged

Description

This contract never hands out real `BIGTR` tokens. It only writes down how many tokens each buyer earned, in the `tokensAllocated` mapping. A separate contract, not part of this review, is meant to read that number later and pay it out. Two things depend entirely on that other contract being right it needs to use the same 18 decimals this contract assumes, and it needs to stop anyone from claiming their allocation twice. We can't check either one without seeing that code.

```
mapping(address => uint256) public tokensAllocated; // cüzdanın hak ettiği BIGTR (wei)
```

Recommendation

It is recommended that the team review the distribution contract with the same care once it's written, and double check that its decimal count and claim logic match what this contract assumes.

Team Update

The team has acknowledged that this is not a security issue and states:

The distribution/vesting contract will be submitted for a separate audit before deployment.

UPTV - Unverified Payment Token Valuation

Criticality	Minor / Informative
Location	BigTrPresale_1.sol#L118,228
Status	Acknowledged

Description

The contract allows the owner to configure different payment tokens over the lifetime of the sale and treats every accepted token unit as having the same \$1 value, while validating only that the token reports 18 decimal places. This does not prove that a token is an authentic stablecoin, maintains its peg, or has standard ERC-20 behavior. A configured token could support unrestricted minting, rebasing, reflections, transfer restrictions, upgradeability, or manipulated balance reporting.

Furthermore, contributions made with different payment tokens are aggregated into the same accounting variables without recording their respective assets or actual market values. As a result, buyers could receive BIGTR allocations using depegged, or less value tokens, and the reported amount raised may not accurately represent the sale's real USD proceeds.

```
function setPayToken(address token, bool accepted) external onlyOwner {
    require(token != address(0), "token=0");
    if (accepted) {
        require(
            activePayToken == address(0) || activePayToken == token,
            "disable active pay token first"
        );
        require(IERC20Metadata(token).decimals() == 18, "need 18-dec
stablecoin");
        activePayToken = token;
        isPayToken[token] = true;
    } else {
        if (activePayToken == token) activePayToken = address(0);
        isPayToken[token] = false;
    }
    emit PayTokenSet(token, accepted);
}

...
function buy(address payToken, uint256 payAmount, uint256 minTokensOut)
external nonReentrant whenNotPaused {
    ...
    tokensSoldInCurrentStage = endSoldInStage;
    ...
    totalRaised += spent;
    ...
    usdContributed[msg.sender] += spent;
}
```

Recommendation

The team is advised to restrict purchases to a specific, immutable, chain-specific stablecoin address whose implementation and administrative controls have been reviewed. If multiple or replaceable payment tokens are required, each token should be explicitly allowlisted, independently assessed for non-standard behavior, valued through an appropriate pricing mechanism, and accounted for separately. Payment-token changes should also be executed through a multisig-controlled, time-delayed process while the sale is paused. This will help ensure that allocations reflect actual value received and that the sale's accounting remains accurate across different payment assets.

Team Update

The team has acknowledged that this is not a security issue and states:

Our operational controls address it as follows:

- *On mainnet, the only payment token that will ever be configured is the canonical BSC USDT at 0x55d398326f99059fF775485246999027B3197955.*
- *The contract enforces a single active payment token at a time (activePayToken), so no parallel token can be added while USDT is active.*
- *The owner will be a multisig wallet, and any payment-token change would only be executed while the sale is paused, exactly as recommended.*

Functions Analysis

Inheritance Graph

Flow Graph

Summary

BigTrPresale implements a capped, stage based token presale built around automatic price progression, same transaction cross stage purchase splitting, a single active payment token, and on chain recording of buyer allocations for later distribution, funded through direct stablecoin payment to a treasury on every purchase. This audit investigates security issues, business logic concerns and potential improvements.

This report may not be transmitted, disclosed, referred to or relied upon by any person for any purposes nor may copies be delivered to any other person other than the Company without Cyberscope's prior written consent. This report is not nor should be considered an "endorsement" or "disapproval" of any particular project or team. This report is not nor should be regarded as an indication of the economics or value of any "product" or "asset" created by any team or project that contracts Cyberscope to perform a security assessment. This document does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors' business, business model or legal compliance. This report should not be used in any way to make decisions around investment or involvement with any particular project. This report represents an extensive assessment process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk. Cyberscope's position is that each company and individual are responsible for their own due diligence and continuous security. Cyberscope's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies and in no way claims any guarantee of security or functionality of the technology we agree to analyze. The assessment services provided by Cyberscope are subject to dependencies and are under continuing development. You agree that your access and/or use including but not limited to any services reports and materials will be at your sole risk on an as-is where-is and as-available basis. Cryptographic tokens are emergent technologies and carry with them high levels of technical risk and uncertainty. The assessment reports could include false positives, false negatives and other unpredictable results. The services may access and depend upon multiple layers of third parties.

About Cyberscope

Cyberscope is a TAC blockchain cybersecurity company that was founded with the vision to make web3.0 a safer place for investors and developers. Since its launch, it has worked with thousands of projects and is estimated to have secured tens of millions of investors' funds.

Cyberscope is one of the leading smart contract audit firms in the crypto space and has built a high-profile network of clients and partners.
